The OPA548 device is a low-cost, high-voltage, and high-current operational amplifier that is designed to drive a wide variety of loads. A laser-trimmed, monolithic, integrated circuit provides excellent low-level signal accuracy and high-output voltage and current. The OPA548 operates from either single or dual supplies for design flexibility.
The series uses step-down non-isolated power modules that operate from an input range of 9 up to 53Vdc, with a wide adjustable output voltage range of 3.3 up to 24V. The DDA is ideally suited for generating additional low cost, high current outputs from an existing 24V bus in industrial, semi fabrication and test and measurement equipment.

The major objective of this work is to design wide output range LLC resonant converter with synchronous rectification at the output end and hence optimizing this converter to obtain wide load range at an improved efficiency. The LLC resonant converter is designed to achieve high efficiency at the nominal conditions.

Above 150 °C, the output decreases slowly, but is still as high as 30 V at 300 °C, whereas PEH made of PVDF and PDMS showed no obvious output. This result indicates that the device can operate stably below 150 °C and is still workable at temperatures as high as 300 °C.

Due to the high voltage, you want to use a high impedance divider else it will dissipate significant power. 1 MΩ top resistor and 10 kΩ bottom resistor sounds like it might work. That’s not quite 1/4 W at 480 V in, and of course much less at lower voltages. It also provides 10 kΩ impedance output to drive the A/D input with.

With the interleaving technique and shared primary-side switching network, the circuit secondary-side current stress is halved and the primary-side current stress is largely reduced. Besides, the filter capacitor requirement is reduced. Therefore, the proposed structure is a good option for medium/high power wide output range applications.
